Review is for general compliance with contract documents. Sole responsibility for correctness of dimensions, quantities, and details rests with the contractor. Approval does not relieve contractor of responsibility for means, methods, techniques, sequences, procedures of construction, safety precautions and programs incident thereto. 5. All steel items shall be galvanized as follows:

All nuts, bolts, and washers	ASTM F2329
All other steel items	ASTM A123

5. Bolts shall be ASTM A325 Type 1, (installed per specification Section 700) with single, self-locking nuts. install all nuts as per manufacturer's specifications.
6. All bolt holes shall be equal to the bolt diameter plus $\frac{1}{16}$", prior to galvanizing.
7. Weld metal: E70XX.
8. Welding shall conform to American Welding Society Structural Welding Code (Steel) ANSI/AWS D1.1 (current edition).
9. Shop assemble the entire structure after galvanizing and prior to shipment. If necessary, disassemble and secure components for shipment.
10. Design Live Loads:

    Single load of 500 lb distributed over 2.0 ft transversely to the member.

    Railings: 0.050 klf, both transversely and vertically, acting simultaneously. In addition, a concentrated load of 0.20 kips, which act simultaneously with the above loads at any point at any direction.

    Posts: concentrated load P = 0.20 kips + 0.050 klf x (post spacing) applied transversely.

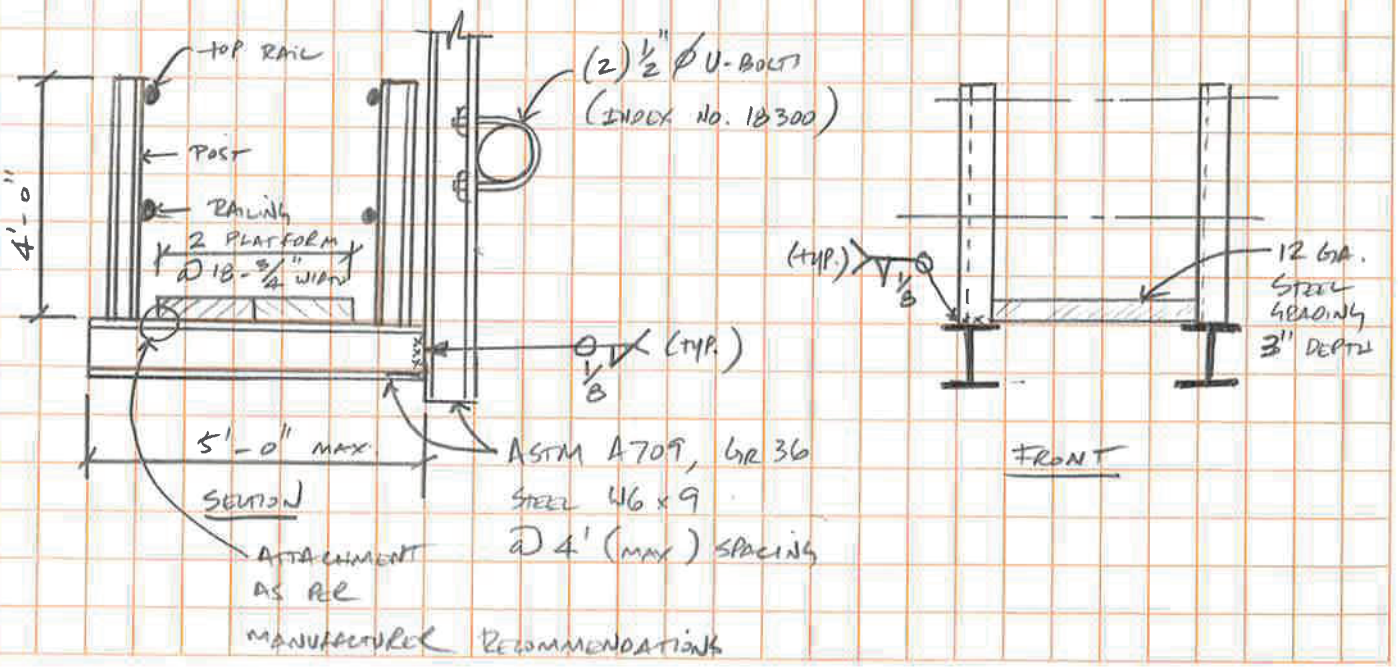
I. DESIGN LOADS



1. SINGLE LOAD OF 500 LB, DISTRIBUTED OVER 2.0 ft TRANSVERSELY TO THE MEMBER SHALL BE USED FOR DESIGNING MEMBERS FOR WALKWAYS AND SERVICE PLATFORMS.

[STANDARD SPECIFICATIONS FOR STRUCTURAL SUPPORTS FOR HIGHWAY SIGNS, LUMINAIRES, AND TRAFFIC SIGNALS 3.6]

2. RAILINGS SHALL BE TAKEN AS $W = 0.050$ KLF, BOTH TRANSVERSELY AND VERTICALLY, ACTING SIMULTANEOUSLY. IN ADDITION, A CONCENTRATED LOAD OF 0.20 KIPS, WHICH ACT SIMULTANEOUSLY WITH THE ABOVE LOADS AT ANY POINT AT ANY DIRECTION.
[LRFD 13.8.2]

3. POSTS, CONCENTRATED LOAD $P_{LL} = 0.20 + 0.050\,L$ APPLIED TRANSVERSELY. [LRFD 13.8.2]

[c] Shape is slender for compression with $F_y = 50$ ksi.
[f] Shape exceeds compact limit for flexure with $F_y = 50$ ksi.
[g] The actual size, combination and orientation of fastener components should be compared with the geometry of the cross section to ensure compatibility.

Determine Required Bolt Size and Number of Bolts for Connection Plates

The truss-to-upright bolted connections are designed in accordance with AASHTO Standard Specifications for Highway Bridges, 17th Edition (2002). Bolts used will be 7/8" diameter or 1" diameter, as required. Bolt spacing is 3.5" per FDOT Design Standards.

Near Field Soil Resistance (kips & kip-ft)

NOTES:

1. The force shown in the last pile node includes
   the force from the bearing spring. The force in
   the bearing spring is also printed separately
   at the end of the section.

2. The soil spring forces in the Xp, Yp, and Zp directions

represent the components of the soil resistance in the pier-local coordinates.

3. The axial force represents the soil resistance developed along the local orientation of the pile axis.

B. Moment Design

A few recommendations on bar size and spacing are available to minimize problems during construction.

- Use the same size and spacing of reinforcing for both the negative and positive moment regions. This prevents field errors whereas the top steel is mistakenly placed at the bottom or vice versa.
- If this arrangement is not possible, give preference to maintaining the same spacing between the top and bottom reinforcement. Same grid pattern allows the concrete vibrator to be more effective in reaching the full depth of the cap.

The design procedure consists of calculating the reinforcement required to satisfy the design moment, then checking this reinforcement against criteria for crack control, minimum reinforcement, maximum reinforcement, shrinkage and temperature reinforcement, and distribution of reinforcement. The procedure is the same for both positive and negative moment regions.

$$M_r := M_{Strength1.pos} = 501 \cdot ft \cdot kip$$

Factored resistance

$$M_r = \phi \cdot M_n$$

Nominal flexural resistance

$$M_n = A_{ps} \cdot f_{ps} \cdot \left(d_p - \frac{a}{2} \right) + A_s \cdot f_s \cdot \left(d_s - \frac{a}{2} \right) - A'_s \cdot f'_s \cdot \left(d'_s - \frac{a}{2} \right) + 0.85 \cdot f'_c \cdot \left(b - b_w \right) \cdot h_f \cdot \left(\frac{a}{2} - \frac{h_f}{2} \right)$$

For a rectangular, non-prestressed section,

$$M_n = A_s \cdot f_s \cdot \left(d_s - \frac{a}{2} \right)$$

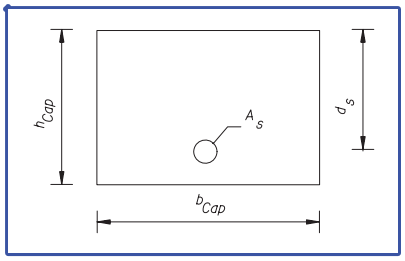
$$a = \frac{A_s \cdot f_y}{0.85 \cdot f'_c \cdot b}$$

Assume $f_s := f_y$ [LRFD 5.7.2.1]

B1. Positive Moment Region Design - Flexural Resistance [LRFD 5.7.3.2]

Using variables defined in above.....

$$M_r = \phi \cdot A_{s.pos} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b} \right) \right]$$



where $f_{c.sub} = 8.5 \cdot ksi$

$f_y = 60 \cdot ksi$

$\phi = 0.9$

$h_{Cap} = 96 \cdot in$

$b_{Cap} = 30 \cdot in$

Initial assumption for area of steel required

Initial assumption for the area of steel required, this process is iterative..... $A_{sreq} := A_{s.pos} = 1.86 \cdot in^2$

Solve the quadratic equation for the area of steel required..... Given $M_r = \phi \cdot A_{sreq} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{sreq} \cdot f_s}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right]$

Area of steel required..... $A_{s.required} := \text{Find}(A_{sreq}) = 1.21 \cdot in^2$

Once $A_{s.pos}$ is greater than $A_{s.reqd}$, the proposed reinforcing is adequate for the applied moments.

Moment capacity provided..... $M_{r.pos} := \phi \cdot A_{s.pos} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right] = 767.4 \cdot kip \cdot ft$

B2. Limits for Reinforcement [LRFD 5.7.3.3]

Minimum Reinforcement

The minimum reinforcement requirements ensure the moment capacity provided is at least equal to the lesser of the cracking moment and 1.33 times the factored moment required by the applicable strength load combinations.

Check that the capacity provided, $M_{r.pos} = 767.4\,ft \cdot kip$, exceeds minimum requirements, $M_{r.reqd} = 666.7\,ft \cdot kip$.

$$LRFD_{5.7.3.3.2} := \begin{cases} "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied" & if\ M_{r.pos} \geq M_{r.reqd} \\ "NG, reinforcement\ for\ positive\ moment\ is\ less\ than\ minimum" & otherwise \end{cases}$$

$LRFD_{5.7.3.3.2} = "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied"$

B3. Crack Control by Distribution Reinforcement [LRFD 5.7.3.4]

Concrete is subjected to cracking. Limiting the width of expected cracks under service conditions increases the longevity of the structure. Potential cracks can be minimized through proper placement of the reinforcement. The check for crack control requires that the actual stress in the reinforcement should not exceed the service limit state stress (LRFD 5.7.3.4). The stress equations emphasize bar spacing rather than crack widths.

The maximum spacing of the mild steel reinforcement for control of cracking at the service limit state shall satisfy.....

$$s \le \frac{700 \cdot \gamma_e}{\beta_s \cdot f_{ss}} - 2 \cdot d_c$$

where

$$\beta_s = 1 + \frac{d_c}{0.7\left(h - d_c\right)}$$

Exposure factor for Class 1 exposure condition.....

$$\gamma_e := 1.00$$ **[SDG 3.15.8]**

Overall thickness or depth of the component.....

$$h_{Cap} = 8\ ft$$

Distance from extreme tension fiber to center of closest bar.....

$$d_c := cover_{sub} + \frac{dia}{2} + \frac{3}{4}in = 4.06 \cdot in$$

$$\beta_s := 1 + \frac{d_c}{0.7\left(h_{Cap} - d_c\right)} = 1.06$$

The neutral axis of the section must be determined to determine the actual stress in the reinforcement. This process is iterative, so an initial assumption of the neutral axis must be made.

Guess value $x := 36 \cdot in$

Given

$$\frac{1}{2} \cdot b_{Cap} \cdot x^2 = \frac{E_s}{E_{c.sub}} \cdot A_{s.pos} \cdot \left(d_s - x\right)$$

$$x_{na} := Find(x) = 7.95 \cdot in$$

$$T_s := \frac{M_{Service1.pos}}{d_s - \frac{x_{na}}{3}} = 51.8 \cdot kip$$

Actual stress in the reinforcing steel due to service limit state moment..... $f_{s.actual} := \frac{T_s}{A_{s.pos}} = 27.86 \cdot ksi$

Required reinforcement spacing..... $s_{required} := \frac{700 \cdot \gamma_e \cdot \frac{kip}{in}}{\beta_s \cdot f_{s.actual}} - 2 \cdot d_c = 15.51 \cdot in$

Provided reinforcement spacing..... $bar_{spa} = 4.55 \cdot in$

The required spacing of mild steel reinforcement in the layer closest to the tension face shall not be less than the reinforcement spacing provided due to the service limit state moment.

$$LRFD_{5.7.3.4} := \begin{cases} \text{"OK, crack control for M is satisfied"} & \text{if } s_{required} \geq bar_{spa} \\ \text{"NG, crack control for M not satisfied, provide more reinforcement"} & \text{otherwise} \end{cases}$$

$LRFD_{5.7.3.4} = \text{"OK, crack control for M is satisfied"}$

Minimum area of shrinkage and temperature reinforcement.....

$$A_{shrink.temp} := \min\left[\left[\max\left[\left[\begin{matrix}\left(0.60 \frac{in^2}{ft}\right) \\ \left(0.11 \frac{in^2}{ft}\right) \\ \left[\frac{1.3 \cdot b_{Cap} \cdot h_{Cap} \cdot \frac{kip}{in \cdot ft}}{2\left(b_{Cap} + h_{Cap}\right) \cdot f_y}\right]\end{matrix}\right]\right]\right] = 0.25 \cdot \frac{in^2}{ft}$$

Maximum spacing of shrinkage and temperature reinforcement

$$spacing_{shrink.temp} := \begin{cases} \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 12 \cdot in\right) & \text{if } \left(b_{Cap} > 36in\right) \cdot \left(h_{Cap} > 36in\right) \\ \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 3 \cdot b_{Cap}, 3 \cdot h_{Cap}, 18in\right) & \text{otherwise} \end{cases} = 15.02 \cdot in$$

The bar spacing should be less than the maximum spacing for shrinkage and temperature reinforcement

$$LRFD_{5.7.10.8} := \begin{cases} "OK, minimum shrinkage and temperature requirements" & \text{if } bar_{spa.st} \le spacing_{shrink.temp} \\ "NG, minimum shrinkage and temperature requirements" & \text{otherwise} \end{cases}$$

$LRFD_{5.7.10.8} = "OK, minimum shrinkage and temperature requirements"$

B5. Mass Concrete Provisions [SDG 3.9]

Surface area of pier cap..... $Surface_{cap} := 2 \cdot b_{Cap} \cdot h_{Cap} + \left(2b_{Cap} + 2h_{Cap}\right) \cdot L_{Cap} = 302.5\ ft^2$

Volume of pier cap..... $Volume_{cap} := b_{Cap} \cdot h_{Cap} \cdot L_{Cap} = 250 \cdot ft^3$

Mass concrete provisions apply if the volume to surface area ratio, $\frac{Volume_{cap}}{Surface_{cap}} = 0.83 ft$, exceeds 1 ft and the minimum dimension exceeds 3 feet

$$SDG_{3.9} := \begin{cases} \text{"Use mass concrete provisions"} & \text{if } \frac{Volume_{cap}}{Surface_{cap}} > 1.0 \cdot ft \wedge b_{Cap} > 3 ft \wedge h_{Cap} > 3 ft \\ \text{"Use regular concrete provisions"} & \text{otherwise} \end{cases}$$

$SDG_{3.9} = \text{"Use regular concrete provisions"}$

C. Shear and Torsion Design [LRFD 5.8]

C1. Check if Torsion Design is Required

$T_u := |T_{Strength1.neg}|$ $V_u := |V_{Strength1.neg}|$

For normal weight concrete, torsional effects shall be investigated if..... $T_u > 0.25 \cdot \phi_v \cdot T_{cr}$

and..... $T_{cr} = 0.125 \cdot \sqrt{f_c} \cdot \frac{A_{cp}^2}{p_c} \cdot \sqrt{1 + \frac{f_{pc}}{0.125 \cdot \sqrt{f_c}}}$

Total area enclosed by outside perimeter of concrete cross section..... $A_{cp} := h_{Cap} \cdot b_{Cap} = 20\,ft^2$

Compressive stress in concrete after prestress losses have occured..... $f_{pc} := 0 \cdot psi$

Torsional cracking moment..... $T_{cr} := 0.125 \cdot \sqrt{f_{c.sub} \cdot ksi} \cdot \frac{A_{cp}^2}{p_c} \cdot \sqrt{1 + \frac{f_{pc}}{0.125 \cdot \sqrt{f_{c.sub} \cdot ksi}}} = 999.6 \cdot kip \cdot ft$

$LRFD_{5.8.2} := \begin{cases} \text{"OK, torsion can be neglected"} & \text{if } 0.25 \cdot \phi_v \cdot T_{cr} \geq T_u \\ \text{"NG, torsion shall be investigated..."} & \text{otherwise} \end{cases}$

$LRFD_{5.8.2} = \text{"OK, torsion can be neglected"}$

C2. Determine Nominal Shear Resistance

Effective width of the section..... $b_v := b_{Cap} = 30 \cdot in$

Effective shear depth..... $a := \frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} = 0.51 \cdot in$

$d_v := \max\left(d_s - \frac{a}{2}, 0.9 \cdot d_s, 0.72 \cdot h_{Cap}\right) = 91.68 \cdot in$

Determination of β and θ **(LRFD 5.8.3.4)**

The pier cap is a non-prestressed concrete section not subjected to axial tension. Assuming it has at least the amount of transverse reinforcement specified in **LRFD 5.8.2.5** or an overall depth of less than 16 in, the Simplified Procedure for determining Shear Resistance per LRFD 5.8.3.4.1 may be used.

$\beta := 2$ $\theta := 45 \cdot deg$

Nominal shear resistance of concrete section..... $V_c := 0.0316 \cdot \beta \cdot \sqrt{f_{c.sub} \cdot ksi} \cdot b_v \cdot d_v = 506.8 \cdot kip$

The pier cap has no prestressing. $V_p := 0 \cdot kip$

Number of stirrup bars ("single" "double")..... n_{bars} := "single"

Area of shear reinforcement..... $A_v = 0.620 \cdot in^2$

Diameter of shear reinforcement..... $dia = 0.625 \cdot in$

Nominal shear strength provided by shear reinforcement

$$V_n = V_c + V_p + V_s$$

where..... $V_n := \min\left(\frac{V_u}{\phi_v}, 0.25 \cdot f_{c.sub} \cdot b_v \cdot d_v + V_p\right) = 186.04 \cdot kip$

and..... $V_s := V_n - V_c - V_p = -320.74 \cdot kip$

Spacing of stirrups

Minimum transverse reinforcement..... $s_{min} := \frac{A_v \cdot f_y}{0.0316 \cdot b_v \cdot \sqrt{f_{c.sub} \cdot ksi}} = 13.46 \cdot in$

Transverse reinforcement required..... $s_{req} := if\left(V_s \le 0, s_{min}, \frac{A_v \cdot f_y \cdot d_v \cdot \cot(\theta)}{V_s}\right) = 13.46 \cdot in$

Minimum transverse reinforcement required..... $s := \min\left(s_{min}, s_{req}\right) = 13.46 \cdot in$

Maximum transverse reinforcement spacing

$$s_{max} := if\left[\frac{V_u - \phi_v \cdot V_p}{\phi_v \cdot \left(b_v \cdot d_v\right)} < 0.125 \cdot f_{c.sub}, \min\left(\begin{pmatrix} 0.8 \cdot d_v \\ 24 \cdot in \end{pmatrix}\right), \min\left(\begin{pmatrix} 0.4 \cdot d_v \\ 12 \cdot in \end{pmatrix}\right)\right] = 24 \cdot in$$

Spacing of transverse reinforcement cannot exceed the following spacing..... $spacing := floor\left(\frac{if\left(s_{max} > s, s, s_{max}\right)}{in}\right) \cdot in = 13 \cdot in$

LRFD 5.8.3.5 is applicable at the end bearing support areas. Therefore, this check is ignored.

B2. Limits for Reinforcement [LRFD 5.7.3.3]

B3. Crack Control by Distribution Reinforcement [LRFD 5.7.3.4]

Concrete is subjected to cracking. Limiting the width of expected cracks under service conditions increases the longevity of the structure. Potential cracks can be minimized through proper placement of the reinforcement. The check for crack control requires that the actual stress in the reinforcement should not exceed the service limit state stress (LRFD 5.7.3.4). The stress equations emphasize bar spacing rather than crack widths.

The maximum spacing of the mild steel reinforcement for control of cracking at the service limit state shall satisfy.....

$$s \le \frac{700 \cdot \gamma_e}{\beta_s \cdot f_{ss}} - 2 \cdot d_c$$

where

$$\beta_s = 1 + \frac{d_c}{0.7\left(h - d_c\right)}$$

$$\beta_s := 1 + \frac{d_c}{0.7\left(h_{Cap} - d_c\right)} = 1.22$$

The neutral axis of the section must be determined to determine the actual stress in the reinforcement. This process is iterative, so an initial assumption of the neutral axis must be made.

Given

$$\frac{1}{2} \cdot b_{Cap} \cdot x^2 = \frac{E_s}{E_{c.sub}} \cdot A_{s.pos} \cdot \left(d_s - x\right)$$

$LRFD_{5.7.10.8} = "OK, minimum shrinkage and temperature requirements"$

B5. Mass Concrete Provisions [SDG 3.9]

Surface area of pier cap..... $Surface_{cap} := 2 \cdot b_{Cap} \cdot h_{Cap} + \left(2b_{Cap} + 2h_{Cap}\right) \cdot L_{Cap} = 302.5\ ft^2$

Spacing of transverse reinforcement cannot exceed the following spacing..... $spacing := floor\left(\frac{if\left(s_{max} > s, s, s_{max}\right)}{in}\right) \cdot in = 4 \cdot in$

Determine Required Bolt Size and Number of Bolts for Connection Plates

The truss-to-upright bolted connections are designed in accordance with AASHTO Standard Specifications for Highway Bridges, 17th Edition (2002). Bolts used will be 7/8" diameter or 1" diameter, as required. Bolt spacing is 3.5" per FDOT Design Standards.

- Shape of Section : CIRCULAR

- Steel and Confinement Data

  Number of Steel Layers = 1
  Section/Segment Diameter = 30.0000 in
  Tied/Spiral Reinforcement Flag = 1
  (Spiral = 1, Tied = 2)
  Confinement Flag = 0
  (None = 0, Confined - Tied/Spiral = 1,
  Confined - Tied/Spiral and Casing = 2)

- Total Area of Steel Reinforcement = 8.0000 in^2

  WARNING : The number of bars is changed to a multiple of 4.
  This is to ensure a symmetric section for the
  analysis. The area is changed to result in the
  same total area of steel.

* SOIL RESISTANCE CURVES (P-y, T-z, T-theta, Q-z) *
****

Listed below are the soil curves (P-y, T-z, T-theta) for each depth correspondng to a pile node. Q-z curves are additionally listed for pile tips.

- P-Y Plots for Soil Set 1

P-Multipliers are used in the analysis, if specified by the user. The original (unscaled) P-Y curves are listed below.

Near Field Soil Resistance (kips & kip-ft)

NOTES:

1. The force shown in the last pile node includes
   the force from the bearing spring. The force in
   the bearing spring is also printed separately
   at the end of the section.

2. The soil spring forces in the Xp, Yp, and Zp directions
   represent the components of the soil resistance in
   the pier-local coordinates.

3. The axial force represents the soil resistance
   developed along the local orientation of the pile
   axis.

B. Moment Design

A few recommendations on bar size and spacing are available to minimize problems during construction.

- Use the same size and spacing of reinforcing for both the negative and positive moment regions. This prevents field errors whereas the top steel is mistakenly placed at the bottom or vice versa.
- If this arrangement is not possible, give preference to maintaining the same spacing between the top and bottom reinforcement. Same grid pattern allows the concrete vibrator to be more effective in reaching the full depth of the cap.

The design procedure consists of calculating the reinforcement required to satisfy the design moment, then checking this reinforcement against criteria for crack control, minimum reinforcement, maximum reinforcement, shrinkage and temperature reinforcement, and distribution of reinforcement. The procedure is the same for both positive and negative moment regions.

$$M_r := M_{Strength1.pos} = 108 \cdot ft \cdot kip$$

Factored resistance

$$M_r = \phi \cdot M_n$$

Nominal flexural resistance

$$M_n = A_{ps} \cdot f_{ps} \cdot \left(d_p - \frac{a}{2} \right) + A_s \cdot f_s \cdot \left(d_s - \frac{a}{2} \right) - A'_s \cdot f'_s \cdot \left(d'_s - \frac{a}{2} \right) + 0.85 \cdot f'_c \cdot \left(b - b_w \right) \cdot h_f \cdot \left(\frac{a}{2} - \frac{h_f}{2} \right)$$

For a rectangular, non-prestressed section,

$$M_n = A_s \cdot f_s \cdot \left(d_s - \frac{a}{2} \right)$$

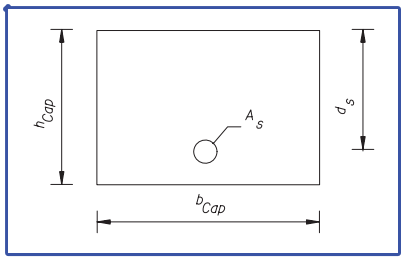
$$a = \frac{A_s \cdot f_y}{0.85 \cdot f'_c \cdot b}$$

Assume $f_s := f_y$ [LRFD 5.7.2.1]

B1. Positive Moment Region Design - Flexural Resistance [LRFD 5.7.3.2]

Using variables defined in above.....

$$M_r = \phi \cdot A_{s.pos} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b} \right) \right]$$



where $f_{c.sub} = 5.5 \cdot ksi$

$f_y = 60 \cdot ksi$

$\phi = 0.9$

$h_{Cap} = 96 \cdot in$

$b_{Cap} = 30 \cdot in$

Initial assumption for area of steel required

Number of bars..... $n_{bar} := 5$

Size of bar..... $bar := "5"$

Note: if bar spacing is "-1", the spacing is less than 3", and a bigger bar size should be selected.

Bar area..... $A_{bar} = 0.310 \cdot in^2$

Bar diameter..... $dia = 0.625 \cdot in$

Equivalent bar spacing..... $bar_{spa} = 5.7 \cdot in$

Area of steel provided..... $A_{s.pos} := n_{bar} \cdot A_{bar} = 1.55 \cdot in^2$

Distance from extreme compressive fiber to centroid of reinforcing steel (assuming a #6 stirrup)..... $d_s := h_{Cap} - cover_{sub} - \frac{dia}{2} - \frac{3}{4} in = 91.9 \cdot in$

Stress block factor..... $\beta_1 := \min\left[\max\left[0.85 - 0.05 \cdot \left(\frac{f_{c.sub} - 4ksi}{ksi} \right), 0.65 \right], 0.85 \right] = 0.78$

Distance between the neutral axis and compressive face..... $c := \frac{A_{s.pos} \cdot f_s}{0.85 \cdot f_{c.sub} \cdot \beta_1 \cdot b_{Cap}} = 0.86 \cdot in$

Initial assumption for the area of steel required, this process is iterative..... $A_{sreq} := A_{s.pos} = 1.55 \cdot in^2$

Solve the quadratic equation for the area of steel required..... Given $M_r = \phi \cdot A_{sreq} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{sreq} \cdot f_s}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right]$

Area of steel required..... $A_{s.required} := \text{Find}(A_{sreq}) = 0.26 \cdot in^2$

The area of steel provided, $A_{s.pos} = 1.55 \cdot in^2$, should be greater than the area of steel required, $A_{s.required} = 0.26 \cdot in^2$. If not, decrease the spacing of the reinforcement. Once $A_{s.pos}$ is greater than $A_{s.reqd}$, the proposed reinforcing is adequate for the applied moments.

Moment capacity provided..... $M_{r.pos} := \phi \cdot A_{s.pos} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right] = 639 \cdot kip \cdot ft$

Check assumption that $f_s = f_y$..... $Check_f_s := if\left(\frac{c}{d_s} < 0.6, "OK", "Not OK" \right)$ $Check_f_s = "OK"$

B2. Limits for Reinforcement [LRFD 5.7.3.3]

Minimum Reinforcement

The minimum reinforcement requirements ensure the moment capacity provided is at least equal to the lesser of the cracking moment and 1.33 times the factored moment required by the applicable strength load combinations.

Modulus of Rupture..... $f_r := -0.24 \cdot \sqrt{f_{c.sub} \cdot ksi} = -562.8\ psi$ [SDG 1.4.1.B]

Required flexural resistance..... $M_{r.reqd} := \min\left(\left| M_{cr} \right|, 133 \cdot \% \cdot M_r \right) = 144.2 \cdot kip \cdot ft$

Check that the capacity provided, $M_{r.pos} = 639 \cdot ft \cdot kip$, exceeds minimum requirements, $M_{r.reqd} = 144.2 \cdot ft \cdot kip$.

$$LRFD_{5.7.3.3.2} := \begin{cases} "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied" & if\ M_{r.pos} \geq M_{r.reqd} \\ "NG, reinforcement\ for\ positive\ moment\ is\ less\ than\ minimum" & otherwise \end{cases}$$

$LRFD_{5.7.3.3.2} = "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied"$

B3. Crack Control by Distribution Reinforcement [LRFD 5.7.3.4]

Concrete is subjected to cracking. Limiting the width of expected cracks under service conditions increases the longevity of the structure. Potential cracks can be minimized through proper placement of the reinforcement. The check for crack control requires that the actual stress in the reinforcement should not exceed the service limit state stress (LRFD 5.7.3.4). The stress equations emphasize bar spacing rather than crack widths.

The maximum spacing of the mild steel reinforcement for control of cracking at the service limit state shall satisfy.....

$$s \le \frac{700 \cdot \gamma_e}{\beta_s \cdot f_{ss}} - 2 \cdot d_c$$

where

$$\beta_s = 1 + \frac{d_c}{0.7\left(h - d_c\right)}$$

Exposure factor for Class 1 exposure condition.....

$$\gamma_e := 1.00$$ **[SDG 3.15.8]**

Overall thickness or depth of the component.....

$$h_{Cap} = 8\ ft$$

Distance from extreme tension fiber to center of closest bar.....

$$d_c := cover_{sub} + \frac{dia}{2} + \frac{3}{4}in = 4.06 \cdot in$$

$$\beta_s := 1 + \frac{d_c}{0.7\left(h_{Cap} - d_c\right)} = 1.06$$

The neutral axis of the section must be determined to determine the actual stress in the reinforcement. This process is iterative, so an initial assumption of the neutral axis must be made.

Guess value $x := 36 \cdot in$

Given

$$\frac{1}{2} \cdot b_{Cap} \cdot x^2 = \frac{E_s}{E_{c.sub}} \cdot A_{s.pos} \cdot \left(d_s - x\right)$$

$$x_{na} := Find(x) = 8.08 \cdot in$$

Tensile force in the reinforcing steel due to service limit state moment.....

$$T_s := \frac{M_{Service1.pos}}{d_s - \frac{x_{na}}{3}} = 11.2 \cdot kip$$

Actual stress in the reinforcing steel due to service limit state moment..... $f_{s.actual} := \frac{T_s}{A_{s.pos}} = 7.24 \cdot ksi$

Required reinforcement spacing..... $s_{required} := \frac{700 \cdot \gamma_e \cdot \frac{kip}{in}}{\beta_s \cdot f_{s.actual}} - 2 \cdot d_c = 82.88 \cdot in$

Provided reinforcement spacing..... $bar_{spa} = 5.69 \cdot in$

The required spacing of mild steel reinforcement in the layer closest to the tension face shall not be less than the reinforcement spacing provided due to the service limit state moment.

$$LRFD_{5.7.3.4} := \begin{cases} \text{"OK, crack control for M is satisfied"} & \text{if } s_{required} \geq bar_{spa} \\ \text{"NG, crack control for M not satisfied, provide more reinforcement"} & \text{otherwise} \end{cases}$$

$LRFD_{5.7.3.4} = \text{"OK, crack control for M is satisfied"}$

B4. Shrinkage and Temperature Reinforcement [LRFD 5.10.8]

Initial assumption for area of steel required

Size of bar..... $bar_{st} := "5"$

Spacing of bar..... $bar_{spa.st} := 8 \cdot in$

Bar area..... $A_{bar} = 0.31 \cdot in^2$

Bar diameter..... $dia = 0.625 \cdot in$

Minimum area of shrinkage and temperature reinforcement.....

$$A_{shrink.temp} := \min\left[\left[\max\left[\left[\begin{matrix}\left(0.60 \frac{in^2}{ft}\right) \\ \left(0.11 \frac{in^2}{ft}\right) \\ \left[\frac{1.3 \cdot b_{Cap} \cdot h_{Cap} \cdot \frac{kip}{in \cdot ft}}{2\left(b_{Cap} + h_{Cap}\right) \cdot f_y}\right]\end{matrix}\right]\right]\right] = 0.25 \cdot \frac{in^2}{ft}$$

Maximum spacing of shrinkage and temperature reinforcement

$$spacing_{shrink.temp} := \begin{cases} \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 12 \cdot in\right) & \text{if } \left(b_{Cap} > 36in\right) \cdot \left(h_{Cap} > 36in\right) \\ \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 3 \cdot b_{Cap}, 3 \cdot h_{Cap}, 18in\right) & \text{otherwise} \end{cases} = 15.02 \cdot in$$

The bar spacing should be less than the maximum spacing for shrinkage and temperature reinforcement

$$LRFD_{5.7.10.8} := \begin{cases} "OK, minimum shrinkage and temperature requirements" & \text{if } bar_{spa.st} \le spacing_{shrink.temp} \\ "NG, minimum shrinkage and temperature requirements" & \text{otherwise} \end{cases}$$

$LRFD_{5.7.10.8} = "OK, minimum shrinkage and temperature requirements"$

B5. Mass Concrete Provisions [SDG 3.9]

Surface area of pier cap..... $Surface_{cap} := 2 \cdot b_{Cap} \cdot h_{Cap} + \left(2b_{Cap} + 2h_{Cap}\right) \cdot L_{Cap} = 292\ ft^2$

Volume of pier cap..... $Volume_{cap} := b_{Cap} \cdot h_{Cap} \cdot L_{Cap} = 240 \cdot ft^3$

Mass concrete provisions apply if the volume to surface area ratio, $\frac{Volume_{cap}}{Surface_{cap}} = 0.82ft$, exceeds 1 ft and the minimum dimension exceeds 3 feet

$$SDG_{3.9} := \begin{cases} \text{"Use mass concrete provisions"} & \text{if } \frac{Volume_{cap}}{Surface_{cap}} > 1.0 \cdot ft \wedge b_{Cap} > 3ft \wedge h_{Cap} > 3ft \\ \text{"Use regular concrete provisions"} & \text{otherwise} \end{cases}$$

$SDG_{3.9} = \text{"Use regular concrete provisions"}$

C. Shear and Torsion Design [LRFD 5.8]

C1. Check if Torsion Design is Required

$T_u := |T_{Strength1.neg}|$ $V_u := |V_{Strength1.neg}|$

For normal weight concrete, torsional effects shall be investigated if..... $T_u > 0.25 \cdot \phi_v \cdot T_{cr}$

and..... $T_{cr} = 0.125 \cdot \sqrt{f_c} \cdot \frac{A_{cp}^2}{p_c} \cdot \sqrt{1 + \frac{f_{pc}}{0.125 \cdot \sqrt{f_c}}}$

Total area enclosed by outside perimeter of concrete cross section..... $A_{cp} := h_{Cap} \cdot b_{Cap} = 20\,ft^2$

Length of outside perimeter of cross section..... $p_c := 2 \cdot (h_{Cap} + b_{Cap}) = 21\,ft$

Compressive stress in concrete after prestress losses have occured..... $f_{pc} := 0 \cdot psi$

Torsional cracking moment..... $T_{cr} := 0.125 \cdot \sqrt{f_{c.sub} \cdot ksi} \cdot \frac{A_{cp}^2}{p_c} \cdot \sqrt{1 + \frac{f_{pc}}{0.125 \cdot \sqrt{f_{c.sub} \cdot ksi}}} = 804.1 \cdot kip \cdot ft$

$LRFD_{5.8.2} := \begin{cases} \text{"OK, torsion can be neglected"} & \text{if } 0.25 \cdot \phi_v \cdot T_{cr} \geq T_u \\ \text{"NG, torsion shall be investigated..."} & \text{otherwise} \end{cases}$

$LRFD_{5.8.2} = \text{"OK, torsion can be neglected"}$

C2. Determine Nominal Shear Resistance

Effective width of the section..... $b_v := b_{Cap} = 30 \cdot in$

Effective shear depth..... $a := \frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} = 0.66 \cdot in$

$d_v := \max\left(d_s - \frac{a}{2}, 0.9 \cdot d_s, 0.72 \cdot h_{Cap}\right) = 91.61 \cdot in$

Determination of β and θ **(LRFD 5.8.3.4)**

The pier cap is a non-prestressed concrete section not subjected to axial tension. Assuming it has at least the amount of transverse reinforcement specified in **LRFD 5.8.2.5** or an overall depth of less than 16 in, the Simplified Procedure for determining Shear Resistance per LRFD 5.8.3.4.1 may be used.

$\beta := 2$ $\theta := 45 \cdot deg$

Nominal shear resistance of concrete section..... $V_c := 0.0316 \cdot \beta \cdot \sqrt{f_{c.sub} \cdot ksi} \cdot b_v \cdot d_v = 407.3 \cdot kip$

$$A_v \geq .0316 \cdot \sqrt{f'_c} \cdot \frac{b_v \cdot s}{f_y}$$

The pier cap has no prestressing. $V_p := 0 \cdot kip$

Stirrups

Size of stirrup bar ("4" "5" "6" "7")... bar := "5"

Number of stirrup bars ("single" "double")..... n_{bars} := "single"

Area of shear reinforcement..... $A_v = 0.620 \cdot in^2$

Diameter of shear reinforcement..... $dia = 0.625 \cdot in$

Nominal shear strength provided by shear reinforcement

$$V_n = V_c + V_p + V_s$$

where..... $V_n := \min\left(\frac{V_u}{\phi_v}, 0.25 \cdot f_{c.sub} \cdot b_v \cdot d_v + V_p\right) = 340.89 \cdot kip$

and..... $V_s := V_n - V_c - V_p = -66.44 \cdot kip$

Spacing of stirrups

Minimum transverse reinforcement..... $s_{min} := \frac{A_v \cdot f_y}{0.0316 \cdot b_v \cdot \sqrt{f_{c.sub} \cdot ksi}} = 16.73 \cdot in$

Transverse reinforcement required..... $s_{req} := if\left(V_s \le 0, s_{min}, \frac{A_v \cdot f_y \cdot d_v \cdot \cot(\theta)}{V_s}\right) = 16.73 \cdot in$

Minimum transverse reinforcement required..... $s := \min\left(s_{min}, s_{req}\right) = 16.73 \cdot in$

Maximum transverse reinforcement spacing

$$s_{max} := if\left[\frac{V_u - \phi_v \cdot V_p}{\phi_v \cdot \left(b_v \cdot d_v\right)} < 0.125 \cdot f_{c.sub}, \min\left(\begin{pmatrix} 0.8 \cdot d_v \\ 24 \cdot in \end{pmatrix}\right), \min\left(\begin{pmatrix} 0.4 \cdot d_v \\ 12 \cdot in \end{pmatrix}\right)\right] = 24 \cdot in$$

Spacing of transverse reinforcement cannot exceed the following spacing..... $spacing := floor\left(\frac{if\left(s_{max} > s, s, s_{max}\right)}{in}\right) \cdot in = 16 \cdot in$

LRFD 5.8.3.5 is applicable at the end bearing support areas. Therefore, this check is ignored.

$$M_n = A_{ps} \cdot f_{ps} \cdot \left(d_p - \frac{a}{2} \right) + A_s \cdot f_s \cdot \left(d_s - \frac{a}{2} \right) - A'_s \cdot f'_s \cdot \left(d'_s - \frac{a}{2} \right) + 0.85 \cdot f'_c \cdot \left(b - b_w \right) \cdot h_f \cdot \left(\frac{a}{2} - \frac{h_f}{2} \right)$$

where $f_{c.sub} = 5.5 \cdot ksi$

$f_y = 60 \cdot ksi$

$\phi = 0.9$

$h_{Cap} = 30 \cdot in$

$b_{Cap} = 96 \cdot in$

Initial assumption for area of steel required

Number of bars..... $n_{bar} := 12$

Size of bar..... $bar := "5"$

Note: if bar spacing is "-1", the spacing is less than 3", and a bigger bar size should be selected.

Initial assumption for the area of steel required, this process is iterative..... $A_{sreq} := A_{s.pos} = 3.72 \cdot in^2$

Solve the quadratic equation for the area of steel required..... Given $M_r = \phi \cdot A_{sreq} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{sreq} \cdot f_s}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right]$

Area of steel required..... $A_{s.required} := \text{Find}(A_{sreq}) = 0.12 \cdot in^2$

The area of steel provided, $A_{s.pos} = 3.72 \cdot in^2$, should be greater than the area of steel required, $A_{s.required} = 0.12 \cdot in^2$. If not, decrease the spacing of the reinforcement. Once $A_{s.pos}$ is greater than $A_{s.reqd}$, the proposed reinforcing is adequate for the applied moments.

Moment capacity provided..... $M_{r.pos} := \phi \cdot A_{s.pos} \cdot f_s \cdot \left[d_s - \frac{1}{2} \cdot \left(\frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} \right) \right] = 430 \cdot kip \cdot ft$

Check assumption that $f_s = f_y$..... $Check_f_s := if\left(\frac{c}{d_s} < 0.6, "OK", "Not OK" \right)$ $Check_f_s = "OK"$

B2. Limits for Reinforcement [LRFD 5.7.3.3]

Minimum Reinforcement

The minimum reinforcement requirements ensure the moment capacity provided is at least equal to the lesser of the cracking moment and 1.33 times the factored moment required by the applicable strength load combinations.

Modulus of Rupture..... $f_r := -0.24 \cdot \sqrt{f_{c.sub} \cdot ksi} = -562.8\ psi$ [SDG 1.4.1.B]

Check that the capacity provided, $M_{r.pos} = 430 \cdot ft \cdot kip$, exceeds minimum requirements, $M_{r.reqd} = 19.4 \cdot ft \cdot kip$.

$$LRFD_{5.7.3.3.2} := \begin{cases} "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied" & \text{if } M_{r.pos} \geq M_{r.reqd} \\ "NG, reinforcement\ for\ positive\ moment\ is\ less\ than\ minimum" & \text{otherwise} \end{cases}$$

$LRFD_{5.7.3.3.2} = "OK, minimum\ reinforcement\ for\ positive\ moment\ is\ satisfied"$

B3. Crack Control by Distribution Reinforcement [LRFD 5.7.3.4]

Concrete is subjected to cracking. Limiting the width of expected cracks under service conditions increases the longevity of the structure. Potential cracks can be minimized through proper placement of the reinforcement. The check for crack control requires that the actual stress in the reinforcement should not exceed the service limit state stress (LRFD 5.7.3.4). The stress equations emphasize bar spacing rather than crack widths.

The maximum spacing of the mild steel reinforcement for control of cracking at the service limit state shall satisfy.....

$$s \le \frac{700 \cdot \gamma_e}{\beta_s \cdot f_{ss}} - 2 \cdot d_c$$

where

$$\beta_s = 1 + \frac{d_c}{0.7\left(h - d_c\right)}$$

Exposure factor for Class 1 exposure condition.....

$\gamma_e := 1.00$ **[SDG 3.15.8]**

Overall thickness or depth of the component.....

$h_{Cap} = 2.5\,ft$

Distance from extreme tension fiber to center of closest bar.....

$$d_c := cover_{sub} + \frac{dia}{2} + \frac{3}{4}in = 4.06 \cdot in$$

$$\beta_s := 1 + \frac{d_c}{0.7\left(h_{Cap} - d_c\right)} = 1.22$$

The neutral axis of the section must be determined to determine the actual stress in the reinforcement. This process is iterative, so an initial assumption of the neutral axis must be made.

Guess value $x := 36 \cdot in$

Given

$$\frac{1}{2} \cdot b_{Cap} \cdot x^2 = \frac{E_s}{E_{c.sub}} \cdot A_{s.pos} \cdot \left(d_s - x\right)$$

Required reinforcement spacing..... $s_{required} := \frac{700 \cdot \gamma_e \cdot \frac{kip}{in}}{\beta_s \cdot f_{s.actual}} - 2 \cdot d_c = 383.47 \cdot in$

Provided reinforcement spacing..... $bar_{spa} = 8.07 \cdot in$

The required spacing of mild steel reinforcement in the layer closest to the tension face shall not be less than the reinforcement spacing provided due to the service limit state moment.

$$LRFD_{5.7.3.4} := \begin{cases} \text{"OK, crack control for M is satisfied"} & \text{if } s_{required} \geq bar_{spa} \\ \text{"NG, crack control for M not satisfied, provide more reinforcement"} & \text{otherwise} \end{cases}$$

$LRFD_{5.7.3.4} = \text{"OK, crack control for M is satisfied"}$

Minimum area of shrinkage and temperature reinforcement.....

$$A_{shrink.temp} := \min\left[\left[\max\left[\left[\begin{matrix}\left(0.60 \frac{in^2}{ft}\right) \\ \left(0.11 \frac{in^2}{ft}\right) \\ \left[\frac{1.3 \cdot b_{Cap} \cdot h_{Cap} \cdot \frac{kip}{in \cdot ft}}{2\left(b_{Cap} + h_{Cap}\right) \cdot f_y}\right]\end{matrix}\right]\right]\right] = 0.25 \cdot \frac{in^2}{ft}$$

Maximum spacing of shrinkage and temperature reinforcement

$$spacing_{shrink.temp} := \begin{cases} \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 12 \cdot in\right) & \text{if } \left(b_{Cap} > 36in\right) \cdot \left(h_{Cap} > 36in\right) \\ \min\left(\frac{A_{bar}}{A_{shrink.temp}}, 3 \cdot b_{Cap}, 3 \cdot h_{Cap}, 18in\right) & \text{otherwise} \end{cases} = 15.02 \cdot in$$

The bar spacing should be less than the maximum spacing for shrinkage and temperature reinforcement

$$LRFD_{5.7.10.8} := \begin{cases} "OK, minimum shrinkage and temperature requirements" & \text{if } bar_{spa.st} \le spacing_{shrink.temp} \\ "NG, minimum shrinkage and temperature requirements" & \text{otherwise} \end{cases}$$

$LRFD_{5.7.10.8} = "OK, minimum shrinkage and temperature requirements"$

B5. Mass Concrete Provisions [SDG 3.9]

Surface area of pier cap..... $Surface_{cap} := 2 \cdot b_{Cap} \cdot h_{Cap} + \left(2b_{Cap} + 2h_{Cap}\right) \cdot L_{Cap} = 292\ ft^2$

Volume of pier cap..... $Volume_{cap} := b_{Cap} \cdot h_{Cap} \cdot L_{Cap} = 240 \cdot ft^3$

Mass concrete provisions apply if the volume to surface area ratio, $\frac{Volume_{cap}}{Surface_{cap}} = 0.82ft$, exceeds 1 ft and the minimum dimension exceeds 3 feet

$$SDG_{3.9} := \begin{cases} \text{"Use mass concrete provisions"} & \text{if } \frac{Volume_{cap}}{Surface_{cap}} > 1.0 \cdot ft \wedge b_{Cap} > 3ft \wedge h_{Cap} > 3ft \\ \text{"Use regular concrete provisions"} & \text{otherwise} \end{cases}$$

$SDG_{3.9} = \text{"Use regular concrete provisions"}$

C. Shear and Torsion Design [LRFD 5.8]

$T_u := |T_{Strength1.neg}|$ $V_u := |V_{Strength1.neg}|$

For normal weight concrete, torsional effects shall be investigated if..... $T_u > 0.25 \cdot \phi_v \cdot T_{cr}$

and..... $T_{cr} = 0.125 \cdot \sqrt{f_c} \cdot \frac{A_{cp}^2}{p_c} \cdot \sqrt{1 + \frac{f_{pc}}{0.125 \cdot \sqrt{f_c}}}$

$LRFD_{5.8.2} := \begin{cases} \text{"OK, torsion can be neglected"} & \text{if } 0.25 \cdot \phi_v \cdot T_{cr} \geq T_u \\ \text{"NG, torsion shall be investigated..."} & \text{otherwise} \end{cases}$

$LRFD_{5.8.2} = \text{"OK, torsion can be neglected"}$

C2. Determine Nominal Shear Resistance

Effective width of the section..... $b_v := b_{Cap} = 96 \cdot in$

Effective shear depth..... $a := \frac{A_{s.pos} \cdot f_y}{0.85 \cdot f_{c.sub} \cdot b_{Cap}} = 0.5 \cdot in$

$d_v := \max\left(d_s - \frac{a}{2}, 0.9 \cdot d_s, 0.72 \cdot h_{Cap}\right) = 25.69 \cdot in$

Determination of β and θ **(LRFD 5.8.3.4)**

The pier cap is a non-prestressed concrete section not subjected to axial tension. Assuming it has at least the amount of transverse reinforcement specified in **LRFD 5.8.2.5** or an overall depth of less than 16 in, the Simplified Procedure for determining Shear Resistance per LRFD 5.8.3.4.1 may be used.

$\beta := 2$ $\theta := 45 \cdot deg$

Nominal shear resistance of concrete section..... $V_c := 0.0316 \cdot \beta \cdot \sqrt{f_{c.sub} \cdot ksi} \cdot b_v \cdot d_v = 365.5 \cdot kip$

$$V_n = V_c + V_p + V_s$$

where..... $V_n := \min\left(\frac{V_u}{\phi_v}, 0.25 \cdot f_{c.sub} \cdot b_v \cdot d_v + V_p\right) = 47.39 \cdot kip$

Minimum transverse reinforcement required..... $s := \min\left(s_{min}, s_{req}\right) = 5.23 \cdot in$

Maximum transverse reinforcement spacing

$$s_{max} := if\left[\frac{V_u - \phi_v \cdot V_p}{\phi_v \cdot \left(b_v \cdot d_v\right)} < 0.125 \cdot f_{c.sub}, \min\left(\begin{pmatrix} 0.8 \cdot d_v \\ 24 \cdot in \end{pmatrix}\right), \min\left(\begin{pmatrix} 0.4 \cdot d_v \\ 12 \cdot in \end{pmatrix}\right)\right] = 20.55 \cdot in$$

Spacing of transverse reinforcement cannot exceed the following spacing..... $spacing := floor\left(\frac{if\left(s_{max} > s, s, s_{max}\right)}{in}\right) \cdot in = 5 \cdot in$

4. HAND DIG THE FIRST 4' AT EACH POLE INSTALLATION LOCATION.

5. AVOID AND/OR PROTECT ALL TREES AND ROOTS BY HAND DIGGING AS NECESSARY.

6. IF WIRES, PVC CONDUIT AND/OR CABINETS TO PTMS LOCATIONS ARE DAMAGED DUE TO PROJECT, THESE SITES NEED TO BE REPAIRED OR REPLACED AS IN THE FIELD. "CALL THE PLANNING DEPARTMENT IF THE INDUCTIVE LOOPS AND/OR PIEZOS ARE CUT, IN ORDER TO PERFORM AN INSPECTION. CONTACT KARA SCHWARTZ 954-777-4364 AND E-MAIL KARA.SCHWARTZ@DOT.STATE.FL .US"

7. ALL TRAFFIC CONTROL DEVICES MAINTAINED BY BROWARD COUNTY / PALM BEACH COUNTY, THAT ARE REMOVED OR DAMAGED BY CONSTRUCTION SHALL BE REPLACED USING CURRENT BROWARD COUNTY / PALM BEACH COUNTY TRAFFIC ENGINEERING DIVISION STANDARDS.

8. THE CONTRACTOR SHALL NOT BRING ANY HAZARDOUS MATERIALS ONTO THE PROJECT. SHOULD THE CONTRACTOR REQUIRE SUCH FOR PERFORMING THE CONTRACTED WORK, THE CONTRACTOR SHALL REQUEST, IN WRITING, WRITTEN PERMISSION FROM THE PROJECT ENGINEER. THE CONTRACTOR SHALL PROVIDE A COPY OF THE REQUEST TO THE DISTRICT CONTAMINATION IMPACT COORDINATOR (DCIC). THE CONTRACTOR SHALL PROVIDE THE DCIC WITH A COPY OF THE MATERIAL SAFETY DATA SHEET (MSDS) FOR EACH HAZARDOUS MATERIAL PROPOSED FOR USE, AND PROVIDE A DESCRIPTION OF THE SPECIFIC MANNER IN WHICH THE MATERIAL WILL BE USED. THE PROJECT ENGINEER SHALL COORDINATE WITH THE DCIC PRIOR TO ISSUING WRITTEN APPROVAL TO THE CONTRACTOR. BECAUSE STATE LAW DOES NOT TREAT PETROLEUM PRODUCTS THAT ARE PROPERLY CONTAINERIZED AS HAZARDOUS MATERIALS, SUCH PRODUCTS DO NOT REQUIRE AN MSDS SUBMITTAL. ALL BULK PETROLEUM PRODUCTS STORED ON SITE SHALL REQUIRE PROPER STORAGE WHICH INCLUDES SECONDARY CONTAINMENT.

9. IF SUSPECT CONTAMINATED OR HAZARDOUS MATERIAL IS FOUND ON THE PROJECT OR ENCOUNTERED DURING CONSTRUCTION, IMMEDIATELY NOTIFY THE DISTRICT CONTAMINATION IMPACT COORDINATOR (DCIC) AT PHONE NUMBER (954) 777-4286.

CONDUIT

1. CONDUIT RUN SHALL NOT EXCEED 270° OF BENDS BETWEEN PULL BOXES.

2. ALL HDPE CONDUIT CONNECTIONS SHALL BE JOINED WITH A MECHANICAL COUPLE OR APPROVED EQUAL.

3. JACK AND BORE OPERATIONS IF USED SHALL MEET THE REQUIREMENTS OF FDOT'S UTILITY ACCOMMODATION MANUAL (LATEST EDITION).

4. CONDUIT INSTALLATION MUST MEET THE CONDUIT INSTALLATION REQUIREMENTS OF THE 2017 UTILITY ACCOMMODATION MANUAL AT A MINIMUM.

5. TRACER WIRE SHALL BE INSTALLED FOR ALL FIBER BACKBONE, FIBER LATERAL, AND MULTI-CONDUCTOR COMMUNICATION CABLE RUNS. THE TRACER WIRE SHALL BE PLACED ALONG THE CENTERLINE OF THE TOP OUTER SURFACE OF INSTALLED CONDUIT RUN DURING TRENCH OPERATION AND INSTALL THE TRACER WIRE IN AN ENCASEMENT FOR A BORING OPERATION.

PULL BOXES

2. FOR I-95 RAMP FIBER OPTIC EXTENSIONS ONLY, STORE 100 FEET OF SLACK FIBER OPTIC CABLE IN THE PULL BOXES.

CABINETS

SLACK CABLE STORE A TOTAL OF 20 FEET OF SPARE FIBER OPTIC CABLE IN CABINETS.

ITS

1. CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING LOCATIONS OF EXISTING AND PROPOSED ROADWAY LIGHTING PRIOR TO INSTALLATION OF DMS, CONDUIT, PULL BOXES AND FOUNDATIONS.

VEGETATION SHALL BE REMOVED OR CUT BACK AS DIRECTED BY THE ENGINEER TO PROVIDE ADEQUATE SIGHT DISTANCE FOR ALL DEVICE LOCATIONS.

3. GROUNDING FOR ALL COMPONENTS SHALL BE PER THE PLANS AND SPECIFICATIONS.

4. ALL DIMENSIONS SHOWN FOR THE PURPOSE OF DEVICE POLE LOCATIONS ARE MADE FROM THE REFERENCE POINT SHOWN TO THE FACE OF THE POLE NEAREST THE ROADWAY.

5. WHEN RUNNING CABLES INSIDE THE STRAIN POLE, ENSURE THAT WATER DOES NOT ENTER THE CABINET BY RUNNING DOWN THE CABLE.

6. AT LOCATIONS WHERE UNDERGROUND UTILITIES OR STORM ARE WITHIN TWO FEET OF THE ITS POLE FOUNDATIONS OR CONDUIT RUN, THE CONTRACTOR WILL HAND DIG THE FIRST FOUR FEET OF THE HOLE FOR THE POLE FOUNDATION AND CONDUIT RUN.
